## Présentation

### Description

The seminar provides concepts of political ecology and political economy relating to environmental/climate change with the global depletion and exploitation of natural resources.

The comparison of current case studies from the Global North and Global South illustrates the unequal causation and distribution of environmental change.

In this interdisciplinary course, students acquire the ability to engage critically with development-related aspects of global environmental change.

They deal with various social and socio-spatial theories and methodologies of human geography and learn to interlink them for practical suggestions and problem-solving strategies.
